

Okechukwu Augustine

Software Engineer

Highly motivated and detail-oriented Industrial and Production Engineer with foundational experience as a Backend Developer Intern. Proven ability in full-stack collaboration and robust system development, seeking to leverage technical skills in a challenging software engineering role.

EDUCATION

University of Benin, Benin City

Bachelor of Engineering (B.Eng Honors) (Second Class Upper - 2:1)

September 2015 - 2021

Industrial and Production Engineering

- Awarded NNPC/CHEVRON Scholarship 2017 - 2020.
- Completed National Youth Service Corps (NYSC) in October 2024.

SKILLS SUMMARY

Languages: TypeScript, Javascript, Node.js.

Frameworks: Express, NestJs, GraphQL, Serverless(Azure stack).

Databases: MongoDB, MySQL, PostgreSQL, Azure Cosmos DB.

Tools: Git, VSCode, Linear, Notion, Swagger, Postman.

Deployments: Render, Heroku, Azure, DigitalOcean, cPanel, Nginx.

Soft Skills: Excellent communication, adaptability, problem-solving, teamwork, time management, leadership, creativity.

WORK EXPERIENCE

Backend Developer - Intern

Enoverlab.

August 2025 - November 2025

- Architected and implemented the backend system for the "Drip Haven" car wash application, managing full application deployment.
- Developed core functionalities including a service assignment engine to match car washers with clients.
- Integrated a secure payment gateway and designed a transactional flow requiring washer completion confirmation and client approval before payment processing.
- Created a real-time location feature enabling clients to track the assigned car washer's location.
- Built administrative oversight modules to monitor system operations, manage user data, and resolve potential errors.

Backend Developer - Intern
HNG Internship.
2025 Lagos, Nigeria.

November 2025 - December

- Debugged and researched technical issues to resolve client problems efficiently.
- Collaborated across development, design, and system administration teams to define and scope new features.
- Developed functional web applications by writing and maintaining clean, scalable backend code.
- Seamlessly integrated user-facing elements with server-side logic in collaboration with front-end developers.
- Enhanced user experience and functionality by improving JavaScript and CSS code.
- Ensured cross-browser and cross-device compatibility by rigorous testing on common operating systems.

PROJECTS

Enoverlab

Drip Haven Backend (Car Wash Service Assignment) | [GitHub](#)

- Architected and deployed the complete backend system for the service application, managing full deployment end-to-end.
- Implemented a robust service assignment engine responsible for matching clients with available car washers.
- Designed and integrated a secure, multi-stage transactional payment flow that requires washer completion confirmation and explicit client approval before processing payment.
- Developed a real-time tracking feature that allowed clients to locate their assigned car washer.
- Created specialized administrative dashboards for comprehensive system monitoring, error resolution, and user data management.

Auth System Backend (JWT Authentication & User Management) | [GitHub](#)

- Architected and deployed a comprehensive authentication and user management backend system using NestJS with end-to-end deployment capabilities.
- Engineered a secure dual-authentication system integrating JWT tokens and Passport.js local strategies for flexible client authentication mechanisms.
- Designed and implemented a PostgreSQL-backed user management layer with TypeORM, featuring encrypted password storage via bcrypt and comprehensive user entity validation through DTOs.
- Developed a containerized deployment pipeline leveraging multi-stage Docker builds and docker-compose orchestration for seamless local development and production deployment workflows.
- Built a modular service architecture with separation of concerns across authentication, user management, and database persistence layers, enabling scalable feature expansion and maintainability.

- Established comprehensive unit and E2E testing infrastructure using Jest, ensuring reliability and code quality across authentication flows and user operations.

Notification System Backend | [GitHub](#)

- Architected and deployed a comprehensive notification delivery system using TypeScript with containerized infrastructure for production-ready deployment.
- Engineered a scalable notification processing pipeline with TypeScript, leveraging modular service architecture for handling multi-channel message delivery and routing.
- Designed and implemented event-driven notification workflows with support for template-based message rendering using Handlebars, enabling dynamic content personalization across notification channels.
- Developed a containerized deployment pipeline utilizing multi-stage Docker builds and docker-compose orchestration for seamless local development and production environment parity.
- Built a robust backend foundation with TypeScript, ensuring type-safe code architecture that reduces runtime errors and enhances maintainability across complex notification workflows.
- Implemented comprehensive error handling and logging mechanisms throughout the notification service layer, enabling effective debugging and system observability in production environments.
